INTRODUCTION

I am a Backend and DevOps Engineer with 3+ years of experience building and operating production systems at scale. I specialize in cloud infrastructure on AWS (EC2, ECS, Fargate), CI/CD pipelines with Jenkins and GitHub Actions, and containerized deployments with Docker. I have hands-on experience with Linux administration, observability tooling (Grafana, Prometheus), and microservices development with Node.js and Python — deploying systems that serve 5M+ concurrent users. My background spans the full lifecycle from API development to infrastructure provisioning and production monitoring.

Skills

Typescript, Node.js, AWS, Docker, Kubernetes, Jenkins, github actions, Linux, Bash, Python, GraphQL, Prometheus, Grafana, AWS EC2, ECS, Fargate, Lambda, Cloudwatch, S3, Secret Manager, MongoDB, Postgres

Professional Experience

- **Stellar Code** Thane, India
Lead & Devops Engineer March 2024 - Ongoing
 - Lead a team of backend and DevOps engineers. I review pull requests by developers and merge with production code. I set up and manage AWS infrastructure including **EC2** instances and **ECS** containers for deployment. I integrate and deploy the final code, monitor and maintain it in production environments.
 - Implemented **AWS Secret Manager** service to securely save private keys and load them into the code only during runtime.
 - Built automation scripts in **Bash** and **Python** for infrastructure management. Managed version control workflows using **Git**. Monitored and maintained live servers handling 5M+ concurrent users.
 - Deployed and managed applications on **AWS EC2, ECS, Fargate** and **Lambda**. Configured load balancing and auto-scaling for high availability. This increased the uptime of application from 50% to 85%.
 - Dockerized the backend code and hosted it on the kubernetes cluster on AWS. Used **Jenkins** and **Github actions** to set up **CI/CD** pipelines. Created a sandbox environment for dev testing and QA. Improved the load time of APIs by optimizing the database queries.
 - Setup Grafana and Prometheus for real time monitoring of the system.
- **Element Zero Labs** Pune, India
Fullstack Developer Dec 2021 - Jul 2023
 - Worked with a team of 4 backend engineers. Planned and executed backend infrastructure for products including API services, payment systems, decentralized systems, and custodial wallet systems.
 - Built Python and **Node.js** backend services. Implemented REST APIs and webhooks. Developed caching layers using Redis. Managed database operations and query optimization.
 - Managed version control using **Git**. Automated deployment processes with Python scripts. Worked with devops engineer to containerize applications using **Docker**.
 - Built backend systems using Python with **MVC framework** architecture. Developed microservices-based backend with Node.js. Implemented real-time data processing and state management.
 - Integrated backend **GraphQL APIs** with frontend systems. Wrote automated test cases and deployment scripts. Maintained code quality through code reviews and Git workflows.

Education

- **Mumbai University - Datta Meghe College of Engineering (DMCE)** Mumbai, India
BE - Bachelor of Electronics Engineering Apr 2018 - May 2024

Projects

- **Referral model with multi level commission**
Node.js, Python, AWS
 - Built an app with referral model that pays out commissions based on a 20 levels compensation plan. The commission distribution was built on the solana blockchain. The project has been live on the mainnet since july 2024.
- **Social Media Platform**
Node.js, React.js, MongoDB, AWS
 - Built a social media platform where users can make posts and groups. users can like, comment and share post. Implement Websockets for real time posting and messaging. Built a secure Admin panel for monitoring and reporting of the app.
- **Github Actions Pipeline with AWS ECS**
Github, AWS ECS, AWS Fargate, AWS ECR
 - I introduced the first pipeline workflow in my organization to create a docker image on a push to the main branch. The pipeline will run the test and build command before creating a new docker image and storing it in ECR. The ArgoCD will then monitor for new images, and when a new image is detected it would trigger the deployment of the image on the AWS ECS configuration.
